

Rural Pact Conference

15-16 June 2022

Towards a Rural Observatory

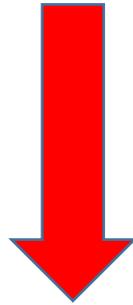

EU Rural Action Plan: Transversal actions

RURAL PROOFING will be introduced to review major EU policies and consider potential impacts and implications on rural areas.

A RURAL OBSERVATORY will be set up in the Commission to deepen data collection and analysis on rural areas to support policymaking.

- ...is an integral part of the Long-Term Vision for Rural Areas, under the EU Rural Action Plan
- ...is a transversal action in support of policymaking and rural proofing

EU RURAL ACTION PLAN

The Rural Action Plan will bring different EU policy areas together to turn the Vision into a reality by...

CREATING AN INNOVATION ECOSYSTEM

Rural revitalisation platform.
Research and innovation for rural communities.

BOOSTING SUSTAINABLE MOBILITY LINKS AND DIGITALISATION

Sustainable multimodal mobility best practices for rural areas.
Promoting digital future for rural areas.

INCREASING ENVIRONMENTAL, CLIMATIC AND SOCIAL RESILIENCE

Support rural municipalities in energy transition and fighting climate change.
Climate action in peatland through carbon farming.
Proposed EU Mission on soil health and food.
Social resilience and women in rural areas.

SUPPORTING ECONOMIC DIVERSIFICATION

Entrepreneurship and social economy in rural areas.

RURAL PROOFING will be introduced to review major EU policies and consider potential impacts and implications on rural areas.

A RURAL OBSERVATORY will be set up in the Commission to deepen data collection and analysis on rural areas to support policymaking.

"Our rural areas are the fabric of our society and the heartbeat of our economy"

President von der Leyen - July 2019
(Policy guidelines for 2019-2024)

Scope of the Rural Observatory

- **Collection and production of indicators** targeted to the analysis of rural areas
- Setup of a **Rural Data Platform** to disseminate data and knowledge on rural areas, which provides:
 - comparability
 - full EU coverage
- Elaboration of **analytical papers** with focus on prominent rural topics
- Integration of **contributions from external stakeholders and experts**

Thematic areas

-  • **Demography** (depopulation, age structure, projections)
-  • **Economic development** (GDP, tourism, farming)
-  • **Labour** (employment and unemployment, gender gap)
-  • **Education** (tertiary education, early leavers, digital skills)
-  • **Social inclusion** (risk of poverty or social exclusion)
-  • **Infrastructure and accessibility**
(service accessibility, transport networks, high-speed broadband access)
-  • **Environment and climate** (green transition)
-  • **Rural innovation** (digitalisation, cooperation and networks)

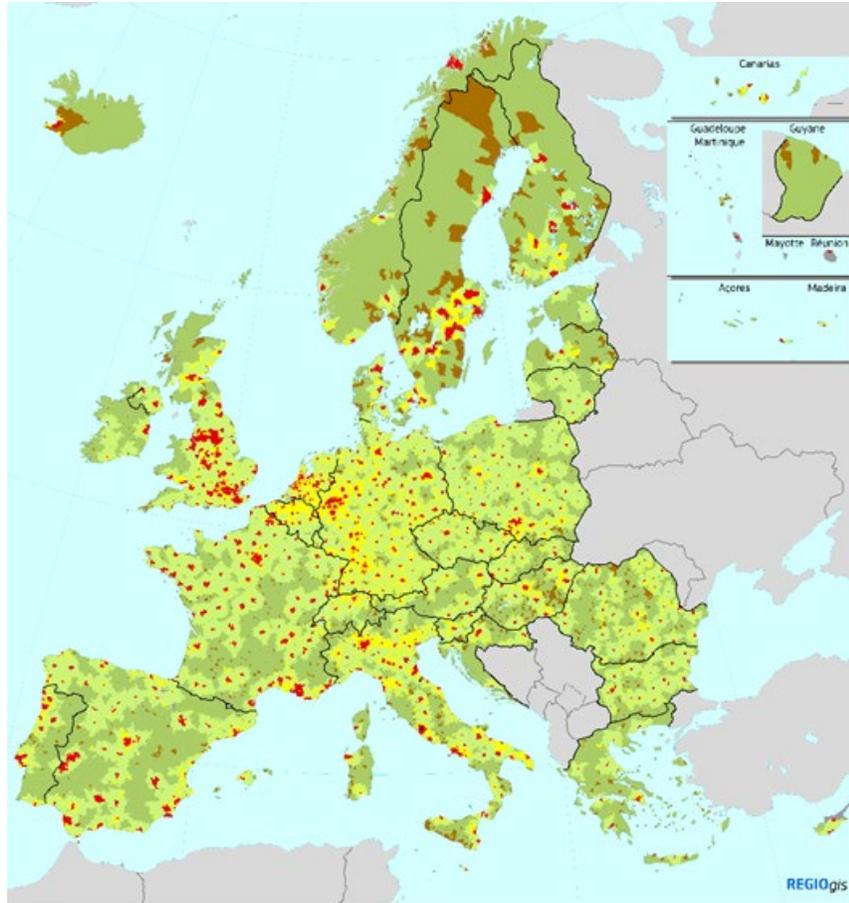

Where are the rural areas?

- Focus on “territorial typologies”, which divide the territory of each country into sets of homogenous areas:
 - **Degree of Urbanisation** (based on municipalities – or LAU)
 - **Urban/Rural Typology** (based on districts/provinces, or NUTS3)
 - Mountain/Non mountain (NUTS3)
 - Metro/Non Metro (NUTS3)
 - Coastal areas (LAU, NUTS3)

The Rural Observatory will contribute to the analysis of diverse territories (cross-border, outermost regions, mountains, islands, sparsely populated, etc.) to reflect the multiple dimensions of rural areas and their links with other territories.

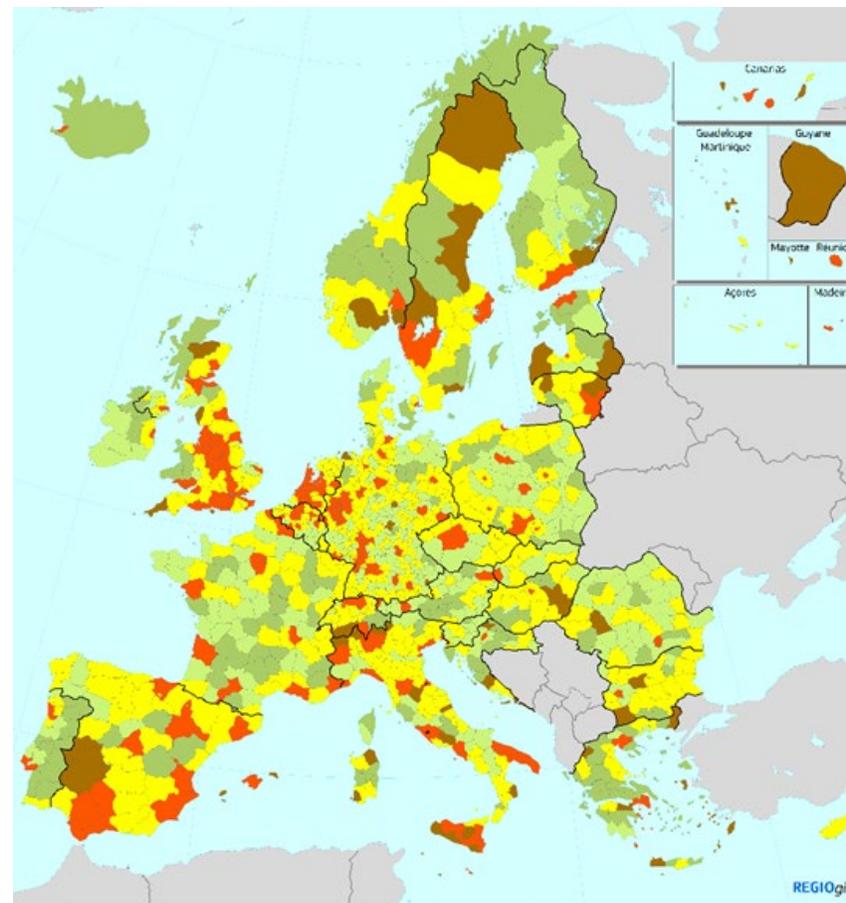

Where are the rural areas?

LAU's: Degree of Urbanisation including remoteness (45 minutes)

- City
- Town and suburb, close to a city
- Town and suburb, remote
- Rural area, close to a city
- Rural area, remote

New! Functional Rural Areas

The “**Functional Rural Areas**” (FRAs):

- do not overlap with the “Functional Urban Areas (FUAs)”
- FRAs and FUAs, together, cover the entire EU territory

Catchment areas around towns and villages are firstly identified. The smallest catchment areas are then combined with the closest one, until a minimum population size is reached

Beyond official statistics

Tourism capacity, expenditure and seasonality in Europe by urban-rural typology and remoteness

Headlines

- Tourism is an important activity contributing to employment and economic growth. In 2010 tourism contributed directly, indirectly and induced around 10% of the European GDP and employment.
- In 2010 tourism expenditures amounted a total of 455,026 million euro. Domestic tourism was the most important component for urban regions and regions close to cities, while rural remote regions attracted EU and extra EU tourists.
- In 2010 the total number of nights spent by tourists was roughly three times more in urban and areas close to a city than in rural and remote areas. However, in some countries (e.g Austria, Greece, etc.) the rural tourism (per capita) was relevant.
- Certain rural regions in France, Italy, Spain have already considerable capacity to accommodate visitors. Austrian rural regions are models of mountain and nature tourism.
- Tourists prefer summer months than winter ones. Looking only at data for rural remote areas, Finland, Bulgaria and Austria are the only countries where tourism is the highest during winter. Seasonality peaks in rural remote areas are mainly linked to mountain and nature tourism.
- Tourism can act as "engine" of regional/local development especially in rural and remote places and if several economic sectors are developed at the same time and provide a diversification of business and income opportunities
- Tourism was highly affected by the COVID-19 pandemic with a considerable decrease in tourists' trips and expenditures. Results of recent surveys show new preferences for low tourist density destinations after the COVID-19 outbreak.

Motivation

This policy brief has been elaborated based on findings in support to the EC Communication on a Vision for Rural Areas, preparing an analytical Ste Document showing the situation and trends in rural regions, including remote ones. The document is elaborated by the DG for Agriculture and Rural De DG for Regional and Urban Policy, DG EUROSTAT and Research Centre.

The main objective of this policy brief is to provide a capacity, expenditure and seasonality of tourism in urban-rural typology and remoteness before the pandemic and, at the same time, to enrich this infan new evidences acquired during this first year of C analysis can support policies aiming at turning chal opportunities, especially in remote areas, both in the recovery and beyond.

Introduction

EU is a major tourist destination, with five Member States among the world's top ten destinations for holidaymakers, according to UNWTO data¹. Tourism has been one of the first and most severely affected sectors since the start of the COVID-19 pandemic in Europe. During 2020, tourism came to an almost complete halt in EU-27 (European Commission, 2020).

Variations in tourism flows can be substantial both at a national and regional levels. While some countries and regions host mostly domestic tourists, others rely more on foreign visitors from both EU and extra-EU (Ribeiro Barranco et al, 2020). The recovery also differs depending on tourists origin where regions more dependent on foreign tourism are more vulnerable when compared to those with a strong focus on domestic flows.

Recent surveys show new preferences for low density destinations and to an increase in a more sustainable and eco-inclusive consumer behaviour especially among younger generations. In addition, regions less affected by COVID-19 are

Accessibility to services in Europe's member states - an evaluation by degree of urbanisation and remoteness

Headlines

- This policy brief outlines present-day challenges to service accessibility across the EU, with particular focus on rural and remote rural areas.
- It provides information on the accessibility of selected Services of General Interest (SGI) including retailers, banks, pharmacies, hospitals, cinemas, primary and secondary schools.
- The results of the analysis suggest that service accessibility shows substantial differences among member states, and between urban and rural areas.
- Urban areas in the EU provide better opportunities in terms of accessibility to services compared to rural areas.
- In rural areas, it is harder to provide necessary conditions for economic viability of a service. Hence, service accessibility in these areas is lower and people have to travel larger distances to reach a service area or facility.
- Unfortunately, expected changes in demographic factors might exacerbate this separation of service accessibility between urban and rural areas.
- New technologies in digitalization, smarter consolidation, collaboration, and management policies of service provision, together with innovative solutions in the transportation sector, might allow rural and sparsely populated regions to mitigate this undesired trend in the face of ongoing demographic challenges.

Motivation

The sustenance of access to services is a key concern for Europe's rural areas. Poor access to services reduces quality of life; worsens economic disparities with urban areas; increases dependency on unsustainable transport modes; and forms an additional hardship for mobility-impaired citizens.

This policy brief outlines present-day challenges to service accessibility across the EU, with particular focus on rural and remote rural areas. It has been produced in pair with the staff working document for the upcoming Long Term Vision for Rural Areas¹, and is meant to provide more descriptive detail on the analyses shared in that document. More generally, this report is part of a broader effort by DG REGIO, OECD and the JRC to assess challenges in the sustenance of service accessibility, which is done to assist in identifying sound cohesion and social policies. OECD (2021) describes potential measures to maintain quality of education in the face of demographic change. A report from JRC and OECD, forthcoming in 2021, will sketch the cost and access implications of foreseen demographic change. Other planning reports and papers will examine the local accessibility implications of population changes that occurred recently, between 2011 and 2018, and the relationship between regional settlement structures and service provision.

Introduction

Accessibility is an important component of integrated land-use and transportation systems. In broad terms, it measures ease of reaching economic opportunities and / or service areas using proper transport infrastructure and means. It is a key instrument for regional policy in monitoring sustainable urban and rural development. Accessibility measurements are given particular importance for the evaluation of the European Union's cohesion and territorial policy. They are seen as a key element to provide useful information on the fair and balanced distribution of services among regions, as well as on the adequacy of transportation infrastructure.

Territorial Facts and Trends in the EU Rural Areas within 2015-2030

A demographic assessment of EU remote areas by 2050

Headlines

- By 2050, the main EU wide demographic trend in remote rural areas is characterised by an ageing population, along with a decline of the working age and youth population.
- In 2015, remote rural regions were home to 6.5% of the EU population, representing about 22.6 million inhabitants. Since the 1960s, remote areas have lost more than 5 million people and they are expected to decline continuously in the far foreseeable future.
- The old-age dependency ratio is expected to increase in remote rural areas in all the EU countries by 2050. This might plausibly lead to an increased burden on the working population to maintain the rest of the economically dependent population.
- In terms of gender, there are less women living in remote rural areas compared to non-remote rural, cities or towns. While shares of women in the economically active age classes are typically under 50%, elderly women are overrepresented in most of the remote rural areas.
- Municipalities located in Bulgaria, Spain, Romania, Cyprus and Austria may face the possibly worst-case demographic scenario by 2050 in terms of population and age group trends.

Introduction

This brief focuses on the territorial dimension of remoteness, especially in rural areas. Past and future population trends, age structure, dependency ratios and gender issues in remote rural areas are analyzed. Future work will further explore the economic performance (sectoral employment) along with the land-use transformations that characterise remote rural areas.

During the last decades, population living in remote have experienced different demographic challenges such as depopulation and ageing. In many territories depopulation is caused by natural population change, negative net migration or both, while ageing is mainly due to the decline of the birth rate and the raise of life expectancy. A strong relationship exists between both demographic processes that can impact on economic growth, attitudes, social and political behaviours (Goujon et al., 2021).

Moreover, remote areas are traditionally characterized by low density of population along with scarce and probably inefficient infrastructures and public services, lower accessibility (physical and digital) and higher risk of land abandonment (Pepiñá et al., 2018). This implies that remote areas might have limited socioeconomic opportunities and developments due mainly to long travelling time to urban centres and associated markets, then, with high costs and less competitiveness (Lange et al., 2013).

In spite of this challenging situation, remote rural areas present a range of possible opportunities that could focus on restoring biodiversity and counteracting land degradation, promoting
